M1 Lab Exercise: I-P-O for Senior Citizen Discount

Input

- Enter the original price.
- Enter the 20% discount.
- Enter the formula for the senior citizen discount:
- $\text{original price} * 20\%$
= amount of discount
- For example:
- $\text{original price} = 500$
- $500 * 20\% = 100$
- 100 is the amount of discount.

Process

- Store the original amount in memory.
- Store the 20% discount in memory.
- Subtract the 20% discount from the original price:
- $\text{original price} - \text{amount of discount}$
= total discounted price to be paid
- For example:
- $\text{original price} = 500$
- $\text{amount of discount} = 100$
- $500 - 100 = 400$
- 400 is the total discounted price to be paid.

Output

- Display the original price.
- Display the amount of discount.
- Display the total discounted price to be paid by the senior citizen.
- For example:
- The original price is 500.
- The amount of discount is 100.
- 400 is the total discounted price to be paid by the senior citizen.
